

# Documentation in transition

**Marie Doleželová**

mdolezel@redhat.com

14/06/2018

# Presentation outline

- **Introduction**
- **Changes of content**
- **Changes of markup language, tooling & publication methods**
- **Handling metadata- previous approach x current approach & future plans**

# Introduction

- Who am I
- Which documentation do I maintain

## **System administrator's guide for Red Hat Enterprise Linux 7**

[https://access.redhat.com/documentation/en-us/red\\_hat\\_enterprise\\_linux/7/html-single/system\\_administrators\\_guide/](https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux/7/html-single/system_administrators_guide/)

## **Kernel administration guide for Red Hat Enterprise Linux 7**

[https://access.redhat.com/documentation/en-us/red\\_hat\\_enterprise\\_linux/7/html/kernel\\_administration\\_guide/](https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux/7/html/kernel_administration_guide/)

# Changes of content

- **Feature-based** (previously) -> **User story-based** (now)
- **Feature-based**  
(comprehensive description of a particular feature, all aspects and attributes of a feature, reference-style content, similar to manual pages)
- **User-story based**  
(action-oriented docs, focused on completion of a particular goal, e.g. a cookbook recipe; capture also prerequisites, important circumstances, steps in the correct order to accomplish the desired goal)
- Nice comprehensive comparison, incl. purpose of both documentation types, their pros and cons provides R. Krátký in **Documentation based on user stories**, see <https://opensource.com/article/17/6/documentation-based-user-stories>

# Examples of feature x user story-based docs

## Feature-based

Network tunables in Kernel administration guide

[https://access.redhat.com/documentation/en-us/red\\_hat\\_enterprise\\_linux/7/html/kernel\\_administration\\_guide/listing\\_of\\_kernel\\_parameters\\_and\\_values#network\\_interface\\_tunables](https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux/7/html/kernel_administration_guide/listing_of_kernel_parameters_and_values#network_interface_tunables)

## User story-based

Getting started with system administration in System administrator's guide

[https://access.redhat.com/documentation/en-us/red\\_hat\\_enterprise\\_linux/7/html/system\\_administrators\\_guide/ch-getting\\_started](https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux/7/html/system_administrators_guide/ch-getting_started)

Common template:

As <type of user>, I want <what?>, so that <why?>

Here:

As a system administrator, I need to perform several tasks just after the operating system has been installed successfully so that the OS is prepared for a user.

# Why and how prepare user story-based docs

## Purpose:

- better meet customers needs
- help to reach customers their goals
- based on input from various stakeholders (feedback from customers via product management, content strategists, support engineers or directly)

## How:

- **a new story written from scratch** (e.g. **Accessibility**, last year presentation, [https://www.nic.cz/files/nic/Technical\\_Writers\\_Workshop\\_2017/RedHat-Accessibility.pdf](https://www.nic.cz/files/nic/Technical_Writers_Workshop_2017/RedHat-Accessibility.pdf))
- **rework the existing content** ( convert the parts that are useful into user stories and remove the rest; as a side effect reduces the amount of content to be developed and maintained; e.g. Getting started with system administration – particular parts already existed as stand-alone chapters, so I choose only things important just after system installation to make basic OS functions work)

# Modular content

3 types of modules:

- **Concept**

- descriptions and explanations needed to understand the product, typically intro parts

- **Procedure**

- how to do something; gives step-by-step instructions

- **Reference**

- some kind of reference data, e.g. list of additional resources, exhaustive list of options ...

- Modules together form assemblies, assembly typically represents a user story; side effect of modules = reusability

- For more info on modular documentation in RH see presentation from 2017 by Aneta Šteflová & Robert Krátký; **Going modular: turning legacy docs into user story-based content**, [https://www.nic.cz/files/nic/Technical\\_Writers\\_Workshop\\_2017/RedHat-Going-modular.pdf](https://www.nic.cz/files/nic/Technical_Writers_Workshop_2017/RedHat-Going-modular.pdf))

# Changes of markup language/ tooling & publication method

- Markup language: **DocBook XML** → **Asciiidoc**
- Previously: **DocBook XML**; content saved in *xml* files; one chapter = one xml file  
(DocBook XML = semantic markup language)
- Now: **Asciiidoc**; content saved in *adoc* files; one module = one adoc file; assembly is a file including links to required modules  
(AsciiDoc = human-readable document format, semantically equivalent to DocBook XML)

# DocBook XML

```

# Asciiid

OC

```
72
73 The following procedure does not affect existing files on the USB storage device unless they have the same path names as the files that you copy onto it.
74 commands as the `root` user:
75 .. Install the [package]*syslinux* package if it is not installed on your system. To do so, as root, run the [command]`yum install [package]*syslinux*pa
76
77 .. Install the [application]*SYSLINUX* bootloader on the USB storage device:
78 +
79 [subs="attributes"]
80 ----
81 #{nbsp}syslinux /dev/sdX1
82 ----
83 +
84 ...where _sdX_ is the device name.
85
86 .. Create mount points for `boot.iso` and the USB storage device:
87 +
88 [subs="attributes"]
89 ----
90 #{nbsp}mkdir /mnt/isoboot /mnt/diskboot
91 ----
92
93 . Mount `boot.iso` :
94 +
95 [subs="attributes"]
96 ----
97 #{nbsp}mount -o loop boot.iso /mnt/isoboot
98 ----
99
100 .. Mount the USB storage device:
101 +
102 [subs="attributes"]
103 ----
104 #{nbsp}mount /dev/sdX1 /mnt/diskboot
105 ----
106
107 .. Copy the [application]*ISOLINUX* files from the `boot.iso` to the USB storage device:
108 +
109 [subs="attributes"]
110 ----
111 #{nbsp}cp /mnt/isoboot/isolinux/* /mnt/diskboot
112 ----
113
114 .. Use the `isolinux.cfg` file from `boot.iso` as the `syslinux.cfg` file for the USB device:
115 +
116 [subs="attributes"]
117 ----
118 #{nbsp}grep -v local /mnt/isoboot/isolinux/isolinux.cfg > /mnt/diskboot/syslinux.cfg
119
120 ----
121
122 .. Unmount `boot.iso` and the USB storage device:
```

# Tooling & publication methods

- **Publican** → **Pantheon**
- **Publican** = open source publishing tool based on DocBook XML
  - for more info see **Publican documentation** at <https://sourceware.org/publican/en-US/index.html>
  - conversion into rpm packages (common format for shipping software in Red Hat)
  - cons and problems:
    - a lot for work on command line to prepare the docs
    - need to run build and check its output
    - long building time → rebuilds not so flexible
    - compatibility issues due to more complicated structure and flexible content of the web

- **Pantheon** = Red Hat internal tool
  - titles built from selected directory in a repository
  - 3 views (preview, stage, production)
  - 2 branches
- pros:
  - user friendly (GUI)
  - build automatically prepared by Pantheon when after any change of the text
  - simple publishing by clicking a button in GUI
  - quick and flexible republishing

# Changes of metadata handling

- **Now**

- **multiple adoc files; info on the whole book/title (not on particular modules this time)**

**(revision history, entities, local attributes (title, subtitle, abstract), “controlling file” = master.adoc)**

**annotations to single modules - only internal info for writers**

# Ideas for future metadata handling

- **annotation, key words, context for every module**  
→ **customer searches based on keywords**
- **automatic generation of suitable documentation for every customer on Red Hat Customer Portal = flexible customer content**
- **based on:**
  - **customer's subscriptions (purchased products)**
  - **docs read by the customer up to now -> building on up to now customer's experience**

**Thanks for your  
attention!**
